## Release of NET-HT Software and Bluetooth Programming Tool for Opus

Effective June 5, 2020 NABCO Entrances will be releasing its new NET-HT Software and plug-in Bluetooth programming module.

This new product enables technicians to quickly and easily program the Opus, U30, U19 and earlier controls with an Android device using the new NET-HT software. The software is licensed and must be obtained from NABCO Entrances. We will be releasing instructions on how to get this software in a later bulletin.

To program with NET-HT software, technicians will need a Bluetooth module kit as shown below. Contact your Customer Service rep at NABCO Entrances to order this kit.

This tool will replace the aging and soon to be discontinued Handy Terminal assembly. Although the Handy Terminal has served us well over the years, newer and better interfaces have become available to program the more advanced controls of today.

Here are some advantages of the new the NET-HT software when used with the Bluetooth module:

1. The ability to save all settings from one door and load those settings onto other doors in a facility.
2. The ability to email settings to another technicians.
3. The ability to quickly and easily compare existing settings with factory default settings.
4. A much more robust programming menu compared the old Handy Terminal menu.
5. One programming tool that techs can retain for all NABCO products both old and new.
6. A software platform that will ensure future modifications can be easily implemented.
7. The ability for the tech to see as much or as little programming adjustments as they need to get the job done.
8. The ability to quickly see which settings deviate from factory default.
